Your device often has many cameras and lenses.

New devices often have 3 lenses on the back. Depending on make and model, they have a long-focus camera, the color camera, and the monochrome camera. The long-focus camera helps to magnify distant objects and to include them in your photo. The monochrome assists in capturing details. One lens maybe for wide angle shots.

The front of your device (selfie mode) also has a camera  
And can be very useful tool in taking photos.

Meeting applications (App) like ZOOM are separate camera on your phone.
